

Amendments to the Specification:

Please replace the paragraph beginning at page 1, line 3, with the following rewritten paragraph:

The present invention ~~utility model~~ relates to a handle, particularly, a handle made of bamboo or wood handle.

Please replace the paragraph beginning at page 1, line 17, with the following rewritten paragraph:

In one technical solution of the present invention, it is provided with a handle, particularly a handle made of bamboo or wood, comprising handle with a round cross section, which is formed by bonding a centric chip with four circumjacent chips, the centric chip having a quadrate cross section and four circumjacent chips, each of which has a curved cross section. The handle with a round cross section is formed by bonding the centric chip with four the circumjacent chips each having a curved cross section.

Please replace the paragraph beginning at page 1, line 21, with the following rewritten paragraph:

In a detailed technical solution of the present invention, it is provided with a handle, particularly a handle made of bamboo or wood, comprising handle with a round cross section, which is formed by bonding a centric chip with four circumjacent chips, the centric chip having a quadrate cross section and four circumjacent chips, each of which has the circumjacent chips each having a curved cross section. The handle with a round cross section is formed by bonding the centric chip with four circumjacent chips. The cross section of each circumjacent chip is comprised of a curved border, a short straight border, and a long straight border. The short straight border with a length shorter than the long straight border is perpendicular to the long straight border. Each long straight border is bonded with the centric chip and each short straight border is bonded with the

neighboring circumjacent chip at a portion where the long straight border of the circumjacent chip extends from the centric chip.

Please replace the paragraph beginning at page 2, line 4, with the following rewritten paragraph:

In a further detailed technical solution of the present invention, it is provided with a handle, particularly a handle made of bamboo or wood, comprising ~~handle with a round cross section, which is formed by bonding a centric chip with four circumjacent chips, the centric chip~~ having a quadrate cross section and four ~~the~~ circumjacent chips, each of which has ~~having~~ a curved cross section. The handle with a round cross section is formed by bonding the centric chip with four circumjacent chips. The cross section of each circumjacent chip is comprised of a curved border, a short straight border, and a long straight border. The short straight border with a length shorter than the long straight border is perpendicular to the long straight border. Each long straight border is bonded with the centric chip and each short straight border is bonded with the neighboring circumjacent chip at a portion where the long straight border of the circumjacent chip extends from the centric chip. The centric chip is formed by bonding two ~~same~~ small chips each having a quadrate cross section.
